Since 1968

Established in 1968 and headquartered in Los Angeles, California, Emser Tile® is a leading designer, producer and marketer of the world's finest tile and natural stone. By offering unparalleled service and a vast selection of products, Emser Tile® is a comprehensive source for interior and exterior products that include porcelain, ceramic, glass, decorative accents, metal, quarry, mosaics, natural and engineered stone, cut-to-size products, setting materials and custom manufactured products made to your specifications. Our nationwide service network includes state of the art distribution centers and local sales and service locations to combine a strong national presence with tailored, local service. Building upon over 50 years of service, our dedication and commitment to our customers remains as strong as ever and is the core of our business and our culture.

Our services are tailored to customers' specific requirements. Emser Tile® offers exclusive programs that help retailers, home builders, commercial builders, contractors, architects and designers exceed their customers' expectations and requirements while keeping projects on schedule and within budget.

Our global network brings the latest trends, technologies and innovations for ceramic and porcelain tile, glass, natural stone, decorative, mosaic and metal products. We continue to offer the most compelling and extensive portfolio of colors, finishes, patterns and textures, accompanied by a broad assortment of coordinating trim and accent pieces.

Our expansive capacity translates into a vast selection of products and immediate distribution. With Emser Tile®, customers have quick access to unique and first-to-market products. With our local sales and service locations and global network of factory alliances, Emser Tile® has the infrastructure to logistically support any size project on a domestic or international level.

GREEN BUILDING INITIATIVE

At Emser Tile®, we embrace our responsibility to protect the planet and create sustainable processes in everything that we do. We hold the same standard for our suppliers and trade partners, and work alongside them to ensure that they adhere to maintaining and improving their standards. Emser Tile®'s Green Building Initiative features a systematic three-prong approach:

- Implementing company-wide environmentally conscious practices in the workplace at all Emser locations throughout North America, including distribution centers. This is a combined effort also shared by our trade partners.
- Practicing transparency of raw materials sourcing with our suppliers, so that we know exactly what ingredients are going into the products we sell down to 1000ppm.
- Educating employees and customers alike through internal and external training programs such as CEU/CES classes regarding health, safety and welfare standards related to material sourcing, manufacturing and installation.

Declare.

Coined the Nutrition Label for products, Emser Tile has been awarded the Declare Label for its transparency in product lifecycle. From where it comes from, what it's made from, to where it goes, Emser Tile's notation of "Red List Free" can fulfill the credit disclosure requirements for LEED v4.

PRIORITIZING SUSTAINABILITY

CORPORATE EFFORTS

Emser Tile® is committed to reducing the environmental impact not only of our corporate headquarters and local sales and service locations, but also all of our distribution centers nationwide.

Our initiatives to do so include:

- Reusing technology, including cell phones, computers, and electronic equipment, through our suppliers and a third-party electronics recycling provider;
- Recycling paper through a third-party shred and recycle service;
- Automating facility lights that operate based on areas in use;
- Programming thermostats for optimal indoor temperatures while maintaining energy efficiency;
- Using low-flow and no-flush plumbing fixtures that preserve water;
- Prioritizing recycled content in office supplies;
- Emser Tile® operates strategically placed distribution centers and local sales and service locations throughout the United States. Having multiple facilities allows us to maximize the volume of every truckload for the most efficient transportation of our products, and in turn, minimizing our carbon footprint.

MATERIAL RESOURCES

Emser Tile® chooses to work with suppliers that recycle the maximum amount of material possible back into the raw bisque, which is then reused to make new tiles. Understanding the importance of water conservation, Emser Tile® suppliers also recycle and reuse water during the manufacturing process. All glazes used in the production of ceramic and porcelain tile are water based and contain zero solvents, reducing potential Volatile Organic Compound (VOC) emissions during production and further eliminating any off-gassing of our finished floor products to 0 g/L through the firing stage of manufacturing. All overseas suppliers are required to be transparent in raw ingredient reporting up to 1000ppm, allowing Emser to meet OSHA Safety Data Sheet (SDS) requirements, as well as Health Product Declarations (HPD v2.1). Preference is given to manufacturers with upgraded kiln equipment that are able to better control heat emission and indoor air quality at the factory level.

Due to their raw ingredient profiles, all products are Red List Free, Conflict Mineral Free, Lead Free and compliant to OSHA Silica Standards as well as Prop 65.

MANUFACTURING, DISTRIBUTION & INSTALLATION

Our transparency efforts specifically complement green friendly builds that are focused around environmental impact in addition to worker health and safety. Unlike other types of hard and soft flooring, the longevity of ceramic, porcelain, and natural stone prevents frequent replacement, reducing the emissions and carbon footprints related to manufacturing, transportation and disposal of waste. With a potential cradle to grave lifecycle of 100+ years, studies have shown that over a 20-year span, ceramic, porcelain, and natural stone products are more cost-effective and sustainable than any other flooring material.

For enhanced eco-friendly attributes, all products and packaging are 100% recyclable, allowing them to be easily diverted from landfills post construction. The inherent characteristics of these surfaces allow for easy installation and cleaning without the use of toxic, high VOC, or harsh chemicals, while also displaying natural antimicrobial properties reducing potential bacteria and mold growth making them a very hygienic option.

Through innovative design, these dense body products can be installed in a way that enhances indoor air quality, creating building efficiency by controlling ambient room temperatures of a space, all while reducing heating and air conditioning costs. Partnered with a Low/No VOC setting materials system, including an installation system warranty, the health, safety and longevity of the application can be optimized.

There are many choices among tile to meet all tastes and preferences. By creating a pattern with tile, one can express his or her personal style and design a truly unique space. A pattern not only alters an appearance, but it can also impact scale. The pattern suggestions are guidelines only — use your unique style and creativity to transform your space.

Our helpful Pattern Calculator can be downloaded from our website, along with our entire selection of patterns.

33% Offset is recommended for staggered floor installations.

For additional pattern selections, please visit www.emser.com.

In a return to form, Citizen™ embraces large format tiles and complementary mosaics. The timelessly classic concrete look is expressed through subtle brushed color variations of tans and grays. Visually arresting, Citizen™ achieves an unencumbered chic aesthetic on floors, walls, and a wide array of surfaces.

Scored Tile

- Pre-scoring provides a consistent design and easy installation.
- Apply grout directly over the scored tile lines. Fusion Pro grout is recommended.
- Scored lines have a grout width of 1/16".
- Gives the impression of a 9"x9" tile install.
- Great for walls and backsplash applications!

The style and name of Cortijo™ is derived from courtyards in the south of Spain. The unique scored design of this 18x18 ceramic floor and wall tile provides the illusion of multiple tiles, but installs with the ease of one. The cool color tone and hexagon styling fits well with both traditional and contemporary designs.

Scored Tile

- Pre-scoring provides a consistent design and easy installation.
- Apply grout directly over the scored tile lines. Fusion Pro grout is recommended.
- Scored lines have a grout width of 1/16".
- Gives the impression of a 9"x9" tile install.
- Great for walls and backsplash applications!

Recommended Maintenance

Sweep, vacuum or damp mop as necessary to remove dust, dirt and grit. Remove heavy spills or spots immediately with a heavy detergent and stiff brush or a non-metallic scouring pad. Routinely mop the surface with a neutral liquid cleaner. Use a simple two bucket method-one bucket containing the diluted cleaner and the other containing clear water. Mop in small areas and change the rinse water regularly. Mop up any dirty cleaning solution and allow the floor to dry thoroughly. Under normal conditions, rinsing is not necessary. However, if the surface is extremely dirty, it should be allowed to dry and mopped again. Over time a natural patina will develop. It can be enhanced with a soft buffing. For applications in restaurants/cafeteria service and dining areas, at least once per week - and more often if necessary - the floor should be scrubbed with a solution of all-purpose cleaner and a scrub brush.

Cleaning and Maintenance: Initial Cleaning and Seasoning

It is the installer's responsibility to thoroughly clean and remove all grout or mortar from the new tile surface. Because grout joints are porous and highly susceptible to staining, you may wish to protect them with an application of a penetrating sealer. If the floor will be subject to frequent staining by fat, oil or grease, you may wish to apply the penetrating sealer to the tile as well. Follow the manufacturer's directions carefully. Seal the floor only after it is thoroughly cleaned and before seasoning the floor. Season the floor by mopping thoroughly with a double strength application of neutral liquid cleaner.

Unglazed quarry tile is the perfect answer for installations that need added durability and slip resistance. Its extruded/die skin body resists breaking, and the relieved edges resist chipping. For an even higher level of slip resistance, an abrasive surface product is available.

E-QUARRY

Unglazed Quarry

Banzai™ • Fervor 6 x 35"

RESOURCES

PRODUCT TESTING & ATTRIBUTES

In order for a tile to be considered for a particular application, various test results must be considered in addition to defining its final use. Usage charts are provided as a general guide only. Actual job site conditions may change a product's suitability for a specific application. If special conditions apply; an Emser Tile® representative should be consulted prior to material selections. All testing is conducted in a lab environment and represents the specific specimens being tested. New production runs, actual jobsite conditions, as well as the handling and installation of products may alter the performance results. For the most current testing results and application usage guide please visit our website at emser.com. The testing and information that should be looked at prior to making selections are as follows:

Water Absorption - ASTM C373

Water absorption is the measurement of density, porosity and specific gravity of a product. It is used as a tool for identifying structural properties of the body of the tile that may be required to determine use in a given application. Tiles are classified according to water absorption percentages as follows:

Impervious tile:	<0.5%
Vitreous tile:	>0.5% - ≤3%
Semi-vitreous tile:	>3% - <7%
Non-vitreous:	>7% - <20%

Breaking Strength - ASTM C648

Breaking strength is measured by applying force to an unsupported portion of tile until breakage occurs. The results are expressed in lbf (pounds of force). This test covers the determination of the breaking strength of glazed and unglazed porcelain and ceramic floor tiles, wall tiles, mosaics, quarry tiles, and paver tiles. Ceramic/ Porcelain tiles used on floors and walls must be able to withstand the expected load bearing capacity of various installations and must meet >250lbf to be considered suitable for floor use. This is a very different measurement of force than PSI and there is no direct conversion of pounds of force to pounds per square inch.

Chemical Resistance - ASTM C650

The chemical resistance test is intended for tile that will be used for lavatories, food counters or similar residential, commercial or medical installations. A tile sample is placed in continuous contact with a variety of chemicals for 24 hours, rinsing the surface and then examining the surface for visible variation. These results are typically measured as a pass or fail.

Freeze Thaw Cycling - ASTM C1026

The freeze thaw cycle test measures a tile's resistance to various stages of freeze cycles. The first step involves soaking the tile in water using a vacuum method to ensure its pores are properly saturated before it is subjected to freezing temperatures. The tile is then monitored for failures. As water expands when it freezes, tiles that are not suitable will show stress cracks, or simply break apart. These results are typically reported as a pass or fail.

Scratch Hardness - MOHS Scale

Scratch hardness is the tile surface resistance to scratching by different minerals, the softest being talc (1) and the hardest being diamond (10). The MOHS scale of hardness is the most common method used to rank gemstones and minerals according to hardness.

Abrasion Resistance - ASTM C1027

Abrasion resistance measures the visible surface abrasion of glazed porcelain and ceramic, glazed quarry, and glazed mosaics by subjecting the test specimens to a rotating abrasion wheel. This test is monitored for failures after a certain number of cycles. Below is the classification for this test:

- O: Wall use only- 100 rotations
- I: Residential, light traffic- 150 rotations
- II: Residential, medium to light traffic- 600 rotations
- III: Residential, heavy traffic; Commercial, light traffic- 750-1,500 rotations
- IV: Commercial, considerable traffic- 2,100-12,000 rotations
- V: Commercial, heavy traffic- >12,000 rotations plus dye test

*Deep Abrasion ASTM C1243 must be used for unglazed products

Deep Abrasion Resistance - ASTM C1243

Deep Abrasion resistance measures the volume removed from an unglazed tile that is subjected to a rotating abrasion wheel. Below is the classification for this test:

- Class 1:** Pressed, extruded, other with <0.50% water absorption - maximum loss 175mm³
- Class 2:** Pressed with >0.50%-3.0% water absorption - maximum loss 225mm³
- Class 2:** Extruded, other with >0.50%-3.0% water absorption - maximum loss 275mm³
- Class 3:** Pressed with >3.00%- 7.00% water absorption - maximum loss 345mm³
- Class 3:** Extruded, other with >3.00%- 7.00% water absorption - maximum loss 393mm³
- Class 4:** Extruded, other with >7.00%-20.00% water absorption - maximum loss 2,365mm³
- Class 4:** Pressed with >7.00%-20.00% water absorption - maximum loss no requirement

Dynamic Coefficient of Friction - ANSI A137.1 and A326.3

The coefficient of friction measurement is an evaluation of a tile surface under known conditions using a standardized sensor material. It provides a useful comparison of tile surfaces, but it does not predict the likelihood a person will or will not slip on a tile surface. DCOF (Dynamic Coefficient of Friction) specifically tests the friction of an object that is already in motion (kinetic). The BOT3000E (Binary Output Tribometer) is a machine that runs approximately 8" across a surface, measures the DCOF of the tile and provides a digital reading with the results. Because this machine is automated, it objectively measures the slip resistance and most importantly provides

repeatable results. ANSI A137.1 recommends, but does not require, a wet result of 0.42 or greater for interior surfaces that are intended to be walked on wet. If the surface is not intended to be walked on wet then a different value may be specified. Some surfaces intended to be walked on wet should be >0.60 depending on final traffic type and use, so specification of “>0.42” may not be sufficient. Although there are no ADA or OSHA benchmarks for DCOF values in the current guidelines and codes for interior applications, Emser recommends a DCOF of 0.50 or greater for covered exterior floor applications as well as interior commercial dining areas due to the presence of grease, water and other contaminants. Emser also recommends that all exposed exterior floors that will be walked on wet meet 0.60 DCOF. If the floors will not be walked on when wet then a lower DCOF may be suitable. There is no direct conversion of ANSI DCOF values to European ISO R-values, however a comparison range can be provided by request.

Shade Variation

Shade variation is the tile’s range from complete inconsistency to a more random appearance. Below is an overview of color and shading of individual tile selections.

- V0** - Monochromatic - Very uniform, monochromatic color
- V1** - Low - Consistent color within each tile and from tile to tile
- V2** - Medium - Color variation within each tile
- V3** - High - Some variation from tile to tile, and within each tile
- V4** - Random - Considerable variation from tile to tile

Glazed Porcelain

Glazed porcelains are manufactured to have superior breaking strength, scratch, wear, dirt and water resistance. Porcelains are a type of ceramic with a much more refined body and are dry pressed. The body of a porcelain has a <0.50% water absorption rate while the glaze applied to the surface of the tile is impermeable. All porcelain tiles are fired in a kiln just like ceramics but they are fired under higher heat for longer periods of time, and under pressure, which adds to the density and durability of the tile.

Glazed Ceramic

Glazed ceramics offer stain and moisture resistance compared to most unglazed clay products. Ceramic tiles are made from a combination of clays, polymers and fine powders such as sand and feldspar. The body of a ceramic is often referred to as a “bisque,” or “clay.” Ceramics have either a red or white body, which is typically determined by the region the clay was mined from. The body of a ceramic has a >0.50% water absorption rate, while the glaze applied to the surface of the tile is impermeable after firing, making it a low maintenance and durable wall or flooring surface.

Glazed Body Match

Glazed products typically have a white or red body, however, a glazed body match tile has a tinted body to match the top glaze color. With glazed porcelain and ceramic tiles, the hardness and abrasion resistance of the glaze will determine product suitability for a particular application. A colored body is more desirable in case the tile chips or scratches and the color of the body becomes exposed. If the body matches the glaze, chips and scratches will not be as evident.

Through-Body/Unglazed

Through-body porcelains are unglazed and exhibit the same color and pattern all the way through the tile. The pressed dry powder method is also known as Single Charging. During this process, fine powders are colored during the pressing stage of production and the pigments are consistent throughout the body of the tile. Through-body porcelain tiles are typically very dense, extremely durable and desirable in applications subject to heavy abrasion. The advantage to using through body products is the ability to bullnose custom trims on site and ability to buff out any light scratching.

Double Loaded

Double Loaded, also known as Double Charging, is formed by fusing two layers of porcelain together. The base layer of porcelain is bonded to an aesthetic top layer where the coloring is already infused into the micro-powders. Once these two layers are pressed together, they are fired to form one solid tile. No glaze is applied to the top surface. These tiles can often be bullnosed just like a through-body as the top and bottom layers are similar in color. The thickness of the top layer is significant enough where the performance characteristics would be the same as a through-body tile.

BEST PRACTICES INSTALLATION

PREP:

PATTERN INSTALLATIONS

Before selecting a multi-size, multi-finish, or multi-product pattern, it is important to understand the nuances of pattern assembly and installation. Having the distribution center dry lay prior to ordering is absolutely necessary to ensure a pattern will work. Grout joint width must be taken into consideration in order for the final pattern design to align properly. Proper overages should be ordered to ensure the entire project is being ordered from appropriate size and shade calibers. When doing a checkerboard pattern, for example, with two tiles that are the same nominal size, from the same series, it may not work if the actual dimensions of the product are not the same. Each color, finish and size may be from a different production run. Selecting tiles from the same series or even the same color does not guarantee that a pattern will work correctly.

DRY LAY PRIOR TO SETTING IN MORTAR

It is standard practice to dry lay all tiles with a pattern as well as mosaic products, especially those with an interlock prior to setting them in mortar. This is especially critical with natural stones that may display V2 Shade variation or higher. Dry laying ensures the interlock is tight, the tiles can be blended properly and the sheet placement and cuts can be planned accordingly.

GAUGED PORCELAIN

It is important to understand gauged porcelain standards for interior installations (ANSI A108.19) prior to beginning any work. Special tools and procedures must be observed to ensure a successful install. There are many things to consider from transportation of A-frames on flat-bed trucks, A-frames to move materials around the jobsite, carrying material up elevators and stair wells, suction cups and special tools for handling, additional surface prep to ensure floor flatness, appropriate tables and tools for cutting, corner protectors, additional labor and the like. Emser Tile, in partnership with its adhesive manufacturers, offers training and information on how to achieve a successful installation in this product category prior to purchasing. As of the publication of this catalog there are no industry standards for exterior use. As such, manufacturer's recommendations prevail. A mortar method can be used for horizontal exterior applications, while a mortar and mortar/fastener method should be considered for vertical exterior applications.

SET:

FINISHING HIGH RELIEF EDGES

3D, textured, split-face and high relief products may be challenging to trim out when coming to a sudden stop in the middle of a wall, when tiling around an outlet, mitering a corner, or butting them up to an adjacent wall covering. Due to the nature of these products, it is best to tile from end to end both vertically and horizontally

whenever possible. Where a stop is necessary, some series may come with a flat field tile that can be used to trim out the desired edges. Otherwise, it may be necessary to simply leave the edge grouted, coordinate bullnose and flat pieces from other series, or install metal profiles. In the case of natural stone split faced edges, hand chiseling may be required. Additional options should be discussed and may be available prior to material specification.

KNOCKING DOWN RIDGES

Before pressing glass tiles and mosaics into adhesive, it is important to knock down the ridges and smooth them out with the flat edge of your trowel, to prevent them from showing through the glass lens, or coming up through thinner mosaic products. In some cases, where back buttering tiles is necessary, it is important these ridges be knocked down as well as not to create stripes or unintentional voids. For glass lens products, any mortar or adhesive that comes up between the tiles may be visible post install.

LEVELING CLIP SYSTEM

A leveling clip system is recommended to achieve narrow grout widths and minimize lippage with planks and large format tiles (those with a single edge being >18"). The clip system will not only allow for a tighter joint, but will minimize the visibility of any inherent warping, or lippage, that may be prevalent in the finished application. Often times a clip system will allow a joint to be narrower than the manufacturer's recommendation and should be discussed with a sales associate prior to specification.

LARGE FORMAT SHOWER FLOOR

Field tiles larger than 6"x6", that meet appropriate DCOF values based on final use, that cannot be sloped towards a center drain on a shower floor, may be sloped to one side using a linear drain. For proper sloping, reference to ANSI installation standards is required.

JOINT WIDTH

ANSI standards recommend that the actual grout joint size be at least three times the actual variation of facial dimensions of the tile supplied. Example: for tile having a total variation of 1/16" in facial dimensions, a minimum of 3/16" grout joint shall be used. Nominal centerline of all joints shall be straight with due allowances for hand molded or rustic tiles. The actual grout joint size may of necessity vary from the grout joint size specified or recommended by the manufacturer.

LIPPAGE ALLOWANCE

For grout joint widths 1/8"-1/4", a 1/32" lippage is allowed during installation. ANSI standards recommend that the total lippage be calculated by adding this allowable lippage for installation to the inherent warping of a product. Installation lippage + warping in manufacturing (within tolerance) = total allowable lippage of a finished assembly. This can be as much as the thickness of a quarter (coin), slightly over 2mm. The presence of lippage can be exaggerated by a number of factors: uneven subfloors, laying large

format tiles in a 50% brick joint offset, not back buttering large format tiles, grout joint width being too narrow and natural and artificial light sources making standard variances more noticeable. Industry standards allow for a certain amount of lippage to be present based on various factors. In backsplashes the most common unavoidable issue that accentuates lippage is under-cabinet lighting, lighting from a hood range washing the tiled wall. Whenever possible all light sources should be a minimum 24" from the wall to prevent shadowing.

UNIVERSAL COVE INSTALLATION

Emser Tile's cove bases are designed to be universal top mount, or inline, with a 3/8" radius to comply with health codes. To use the cove as a top mount, the bottom lip should be cut at the curvature to ensure the curve feathers into the floor it is being placed on top of. This would be most commonly used over existing tile or concrete floors. To be used as an in-line cove, the lip should remain intact and be installed adjacent to the floor tile (not on top of it), so the curvature feathers into the surface of the field tile. To comply with codes, the lip should never be placed on top of an existing floor covering creating a 90 degree angle between perpendicular surfaces. The lip either must be cut off, or sunken in behind the tile/floor. To tile above a universal covebase, the bullnose edge simply needs to be cut off. Alternatively, the top bullnose edge can be left in place when the cove is used as a base trim.

33% OFFSET

For running bond/brick joint patterns utilizing tiles (square or rectangular) where the side being offset is greater than 18" (nominal dimension), the running bond offset will be a maximum of 33% unless otherwise specified by the tile manufacturer. If an offset greater than 33% is specified, specifier and owner must approve mock-up and lippage. In some cases, tiles with an edge larger than 48", by necessity, may only accept a maximum 20% offset. Should tiles in the actual shipment received be completely flat, the final offset can be determined by the specifier and owner and can be 50% only if the tiles and substrates allow it. Some patterns such as a weave, pinwheel or herringbone are considered a 50% offset.

REMOVE AND REPLACE MODULES

When working with any mosaic sheet, especially those with a linear pattern, freeform pattern, or interlocking edge, manipulation by cutting individual modules from the mesh may be necessary to ensure that the product interlocks properly and creates a seamless look. Hand placement of individual pieces should also be considered for best results when working with certain types of freeform patterns to avoid small perimeter cuts.

PREVENTING CHATTER DURING GLASS CUTS

To avoid chipped edges when cutting with a wet saw, position the blade 1/32" short of cutting entirely through the glass. When the cut is complete, simply snap the edge off for the cleanest cut.

GROUT:

GROUTING HIGH RELIEF EDGES

Grouting high relief products may not be necessary in a dry application when the tile is just being used as a decorative wall covering. However, when using tiles in a wet application such as a shower, exterior, or any area that will come in contact with moisture, grease, food, or other types of debris, it may be necessary to grout in between the tiles to prevent water damage, mold growth and other undesirable effects. The best way to do this is with a grout bag and/or brush, to ensure the grout is forced into the joint properly. In some cases where the joint width is very narrow, caulking may be a more suitable option instead of grout.

BRUSHING DURING GROUTING

For the best results during grouting, a medium bristle brush may be required to expose the edge of the pebbles or high relief modules to a desired level and expose any that may have been buried using a standard rubber float.

FORCEFUL GROUTING AND SANDED GROUT

Forceful grouting with sanded and non-sanded grout may scratch the surface of metal, glass, resin, and polished finishes. It is important to be careful when grouting decorative mosaics, tiles with glossy glazes and unglazed polished products. A new rubber float is recommended for these types of finishes to ensure abrasives have not dried onto the float from any previous work.

CARE:

REMOVING NANO COATINGS

Nano coatings are buffed into the surface of polished products to increase luster and protect the tiles during shipping, handling and installation. This finish should not be removed unless it has been compromised during installation. A nano cleaning agent is necessary to evenly remove the coating. Other types of chemicals and detergents may not work if they are not specifically designed to be a nano scrub. A sealer should be applied to the surface after the nano coating is properly removed to aid in day to day cleaning.

Grout Release and Sealing Porcelain, Ceramic, Glass and Metal
When installing matte glazed, unglazed, metallic, textured, crackled, or high DCOF products (>0.50 DCOF wet), the use of a grout release is recommended prior to grouting. This includes frosted and matte finished glass tiles as well. Grout particles may become trapped in the surface pores on a microscopic level, or in the textured grooves of a product and inadvertently create a grout haze. Sometimes this haze can be invisible until it is exposed to dirt. Although glazed and high-density products are generally considered impervious, sealing these types of products after install will aid in day to day cleaning and help eliminate the appearance of fingerprints and other marks only seen under certain angles of

Raimondi® Clip Leveling System

light. Using in appropriate sealers and/or not following the sealing manufacturer's instructions may result in undesirable effects on the tile such as yellowing, or creating a gummy film. All guidelines must be followed prior to application.

OTHER:

WALL WASH LIGHTING

If wall wash lighting that is installed under cabinets, or on a range hood, is positioned closer than the recommended 24" from a wall, specifier and owner must approve a mock-up as well as any lippage effects. The nature of wall wash lighting that is installed too close to a wall surface is such that it may create undesirable and exaggerated shadowing on the tiled surface, making the appearance of tile that is otherwise produced and installed according to industry standards unattractive.

SHADOW EFFECT IN GLASS TILE

When using back painted glass tile and mosaic products, a shadowing effect may be inherent in the finished application, at the grout joints, when viewed at certain angles. This effect is due to a number of factors including mortar ridges showing through, inherent presence of glue on the edges of any mosaic modules, or grout not being forced into the joint properly. It is most noticeable when the mortar is a contrasting color to the grout as well as when light colored grouts are used. In order to blend the appearance of shadows between adjacent tile modules, it is best to tint the mortar to match the grout color, make sure edges of tiles are clean, knock down any trowel ridges, ensure the mortar is not coming up between the tiles and ensure grout joints are properly filled.

MOUNTING SHOWER DOORS/HARDWARE TO GLASS TILES

Glass tiles breaking after being drilled for fixtures is a very common issue, even when the installer does everything correctly, due to a

number of factors such as: tension in the glass from drilling, over-tightening screws, not using rubber washers etc. Glass tiles are generally not recommended behind any type of grab bars, shower doors or any fixtures that need to be drilled into. Where tile is used in this type of application cracks may not be evident immediately during, or after install and may appear at a later time. If a glass tile is used in this type of application, rubber washers, soft joints, drilling into the joint, hand tightening screws, and water jetting holes whenever possible are recommended for optimal results.

GENERAL INSTALLATION LIABILITY

Emser Tile will not be responsible for any materials damaged due to improper installation, installation defects or errors, misuse including negligence, and physical or chemical abuse to the surface of the tile. It is imperative that industry standards and guidelines for installations are followed. Refer to the TCNA Handbook, NTCA Handbook, ANSI, NSI and any other reputable industry sources for guidelines on proper installation as needed.

Euphoria™ • Ocean Arrow

NOTEWORTHY INDUSTRY STANDARDS

ANSI (American National Standards Institute) is the governing body in the tile industry when it comes to both the manufacturing and installation of tile. TCNA (Tile Council of North America) publishes an installation handbook that identifies proper ANSI methods of installation depending on the substrate and the actual scope of work, as well as proper ASTM (American Society for Testing & Materials) methods for product testing. NTCA (national Tile Contractors Association) also publishes annual “How To” and Troubleshooting guides for its members. These guidelines are in place to make sure that manufacturing tolerances are taken into consideration during installation. It is important to understand these standards so that expectations can be set regarding the appearance of both the tiles received and the finished work.

An inherent characteristic of all fired products is that they may bow, wedge and warp to a certain degree causing them to potentially vary in size from batch to batch. These variations in size and color are due to changes in moisture and thermal loads that alter the tiles during production. Batches of tile are identified and separated into lots by specific shade and caliber. To find how out of square, or warped the limits of a tile are, tolerances by product type can be referenced in ANSI A137 manufacturing standards. For installation guidance, the TCNA Handbook or ANSI A108 should be observed.

ANSI A108 Installation Standards are written to accommodate the size variations between tiles. Large format tiles, those having an edge larger than 18”, are more prone to dimensional variations due to their size. If ANSI A108 recommendations for installation are not followed, then the inherent dimensional variation of a tile may be much more noticeable. These standards are written to help ensure successful installation. Lippage will be prominent and grout joints may not line up properly if they are disregarded. Alterations to recommendations should only be made if the actual size variance between tiles and jobsite conditions allows them. Any alterations should be accompanied by a mock up and approval by the installer and end user.

*The standards listed below are current at the time this catalog was published. ANSI standards and ASTM test methods may be subject to various updates throughout the year.

ANSI A108.02, SECTION 4.3.8 GROUT JOINT SIZE:

To accommodate the range in facial dimensions of the tile supplied for a specific project, the actual grout joint size may, of necessity, vary from the grout joint size specified. The actual grout joint size shall be at least three times the actual variation of facial dimensions

of the tile supplied. Example: for tile having a total variation of 1/16” in facial dimensions, a minimum of 3/16” grout joint shall be used. Nominal centerline of all joints shall be straight with due allowances for hand-molded or rustic tiles. In no circumstance shall the grout joint be less than 1/16”.

ANSI A108.02, SECTION 4.3.8.1 RUNNING BOND/BRICK JOINT PATTERNS:

For running bond/brick joint patterns utilizing tiles (square or rectangular) with any side greater than 15”, the grout joint shall be, on average, a minimum of 1/8” wide for rectified tiles and, on average a minimum of 3/16” wide for calibrated (non-rectified) tiles. The grout joint width shall be increased over the minimum requirement by the amount of edge warpage on the longest edge of the actual tiles being installed. For example, for a rectified tile exhibiting 1/32” edge warpage on the longest edge, the minimum grout joint for a running bond/brick joint pattern will be 1/8” + 1/32” or 5/32”, on average. Of necessity, in any installation, some grout joints will be less and some more than the average minimum dimensions to accommodate the specific tiles being installed.

ANSI A108.02, SECTION 4.3.8.2 RUNNING BOND/BRICK JOINT OFFSET:

For running bond/brick joint patterns utilizing tiles (square or rectangular) where the side being offset is greater than 18” (nominal dimension), the running bond offset will be a maximum of 33% unless otherwise specified by the tile manufacturer. If an offset greater than 33% is specified, specifier and owner must approve mock-up and lippage. ANSI A108.02 Section 4.3.7 Lippage guidelines, explanation, and caution: Lippage refers to differences in elevation between edges of adjacent tile modules. These differences or perception thereof are influenced by many factors such as:

1. The allowable thickness variation of the tile modules in accordance with manufacturing standards.
2. The allowable warpage of the tile or stone modules.
3. The spacing or separation of each tile module, which would influence a gradual or abrupt change in elevation.
4. Angle of natural or manufactured light accentuating otherwise acceptable variance in modules.
5. Highly reflective surfaces of tile or stone modules accentuating otherwise acceptable variance in the modules.
6. Variations in the subfloor

The following chart is a guideline for identifying acceptable lippage – this number must be added to the actual warpage of the tile:

TILE TYPE	TILE SIZE	JOINT WIDTH	ALLOWABLE LIPPAGE
Glazed Wall/Mosaics	1x1 to 6x6	1/16 to 1/8	1/32
Quarry	6x6 to 8x8	1/4 or greater	1/16
Paver	All	1/8 to 1/4	1/32
Paver	All	1/4 or greater	1/16

BEST PRACTICES MANUFACTURING

MANUFACTURING TOLERANCES

An inherent characteristic of all fired products is that they may bow, wedge and warp, to a certain degree, causing them to potentially vary in size from batch to batch. Even with regulatory controls in place, these variations in size and color may be inevitable and are due to changes in moisture and thermal loads that alter the product during manufacturing. Batches of tile are identified and separated into lots by specific shade and caliber. Multiple shades and calibers of a single item are accepted within a certain range. To find out what the acceptable out of square and warping tolerance limits are, product types can be referenced in ANSI A137 manufacturing standards. For installation guidance, the TCNA Handbook or ANSI A108 should be observed as they are written with manufacturing tolerances in mind.

FACE PATTERN REPEAT

Although advancements in inkjet technology allow for an increased number of faces before a repeat, all boxes are packaged at random. A box of tile may not be comprised of all unique faces. You may have repeats in your final shipment depending on the square footages that were ordered. Specific face patterns cannot be sorted or requested prior to shipping.

SHADE LOT VARIATION / TRIM COORDINATION

All tiles, whether manufactured or natural stone, are from a particular caliber and shade lot. It is not uncommon for the specific lot your order came from to no longer be available as early as a few weeks after making your original purchase. Block availability from a natural stone quarry and/or the shade and caliber lots of manmade tiles from a particular production run at a factory may be different with each order. On occasion, matching lots may be available. However, it is important to always order appropriate overages for cuts, pattern layouts, and future repairs to ensure a proper match. Trim pieces are intended to coordinate but also may not be made from a matching size and shade caliber. A lot check is recommended when specific requirements must be met. In some cases, special order options may be available.

VARYING SIZE AND FINISH WITHIN A SERIES

Due to the inherent nature of all fired products, size calibers must be observed when ordering multiple tiles, from the same series, for a single application. Field tiles that are used together in a pattern, or ones that must line up with trim, need to be verified against actual dimensions, not nominal dimensions. When specific alignment or coordination of colors and finishes are required, specific lots

need to be checked by request to ensure compatibility between products, even if all components are assembled from a single series.

COUNTRY OF ORIGIN AND QUALITY

All tiles are intended to be produced according to the guidelines set forth by ANSI and NSI manufacturing tolerances, regardless of the country of origin. Country of origin will not necessarily play a role in product performance or quality. The quality and performance of a product are observed in the technical characteristics and lab test results of a series.

MARKINGS ON BACK OF TILE

Arrows and other markings on the back of a tile are not related to the installation or direction the tile should be installed in any way unless explicitly noted on the product packaging, marketing and/or manufacturer's instructions.

METALS

Many modern mosaics and field tiles are made from actual aluminum, stainless steel, metallic foil backing, or metallic glazes. Often times these metals can be adversely affected by weathering, heat and moisture. It is always important to double check usage to ensure your product will not fail in your intended application. Scratching, oxidation, discoloration from heat and chemicals, appearance of finger prints and water spots are not considered a defect, but a natural reaction expected of metals exposed to certain conditions.

CAST METAL TILES

Cast metal tiles contain real metal particles that are combined with polymers and cast into molds. Due to the presence of real metal in these tiles, they are not recommended for exterior applications that are exposed to the elements. Cast metal tile is suitable for interior and covered exterior walls only and is not recommended for floors. The use of a non-sanded grout is recommended as sanded grout may scratch and dull the finish. These tiles are not suitable for pools, or fountains, but may be used in showers and backsplashes as long as they are not exposed to any harsh chemicals or abrasive cleaning.

GLASS TILE TYPES

There are various styles of glass on the market today. "Back painted" is a general term that describes the color application process to what typically starts out as a clear slab of glass tile

and has color applied to the back surface. If you hold the back painted tile sideways, you can see right through the lens. Not all back painted glass tiles are the same; there are subtle differences in manufacturing that define where these tiles can or cannot be used. It is imperative that the glass tile is installed over the proper substrate. To avoid adversely affecting the color of glass tile, white mortar is required for all installations. As most glass has translucent properties, it is important to ensure adequate coverage of mortar by lightly back buttering the tiles. Some types of back painted or back foiled glass are not suitable for exterior or wet applications as the coloring is not designed to hold up to these types of conditions. Glass tiles with a frosted finish will generally not do well when exposed to pool chemicals. For these reasons, usage may be color specific within a series.

CRACKLED AND CRAZED CERAMIC FINISHES

Crackled and crazed finishes are considered a desired look, not a defect, in the glaze of certain tiles. The tiles may be used on wet area walls if properly sealed. They are not recommended for general use on floors and counters. Typically, products with these finishes will have potential size variations adding to the handmade and hand painted look. It is recommended that a grout release, or a sealer be applied to the crackled glaze prior to installation so the tile will not absorb any grout pigments, or installation related debris. After grouting, a penetrating sealer should be used to seal the surface of the tile. Abrasive cleaners should not be used with these types of products.

VOC'S

Certification is not needed to satisfy LEED® specifications with hard flooring surfaces. The test methodology specified in CA Department of Public Health Standard - Section 01350 is the same one used for the following certifications:

SCS/RFI FloorScore

SCS Indoor Advantage, Indoor Advantage Gold

AQSI/GEI Greenguard, Greenguard -Children & Schools

CRI Green Label, Green Label Plus

Due to the manufacturing process of all of our fired floor tiles, the temperatures that these tiles are produced at inherently eliminate the presence of any off-gassing and results in no detectable emissions of Volatile Organic Compounds (VOCs). As such, Emser's floor tiles perform better than the requirements of the FloorScore certification. Hard surface flooring products can contribute to gaining 1 POINT for low-emitting materials in

LEED® V4 rating systems. The credit definition is: "Mineral-based finish flooring products such as tile, masonry, terrazzo, and cut stone without integral organic-based coatings and sealants and unfinished/untreated solid wood flooring qualify for credit without any IAQ testing requirements". For this reason, it is assumed that ceramic and porcelain floor tiles are negligible sources of VOCs and are available for credit without any testing requirements.

TRANSPARENCY

Emser tile practices raw ingredient transparency which can be seen in HPD2.1 and SDS documents. Additional information can be found in our sustainability initiative on www.emser.com as well as in this catalog.

FLAME SPREAD CHARACTERISTICS

Flame spread is measured using ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials, compliant to CBC Chapter 8 Section 803. This test will measure flame spread, fuel contributed, and smoke developed. It is intended for all building materials including everything from counters, fabrics and wall surfaces to cementitious substrates. However, the test method and the building codes do not apply to tiled surfaces. The test itself does not list tile as a required specimen for submission. The time temperature curve this test is conducted at will max out at around 1200 degrees Fahrenheit. Quarry tile, ceramic and porcelain products pass this test as far as fuel and flame spread go. Although, under actual use circumstances, smoke may be caused on the surface of the tile due to a number of outside factors i.e. sealers, cleaners, grease, surface debris etc., which are not a direct cause of the tile itself, but rather due to inherent presence of foreign materials on the surface. Because ASTM E84 is conducted in levels below 1200 degrees and our tiles are manufactured at temperatures greater than 2000 degrees Fahrenheit, the combustion and melting points of our tiles substantially exceed the testing threshold. ASTM E84 is a comparative test where the performance of the test specimen is compared with that of fiber-cement board and select grade red oak flooring, which have been established as 0 and 100, respectively. Testing of floor tiles is not required or a recommended industry practice as they will produce a result of Class A-0 due to their composition.

BEST PRACTICES

NATURAL STONE

NATURAL VARIATION

Variations in veining, fissures, pits, texture, color and shade are inherent characteristics of natural stones and will vary from tile to tile as well as from lot to lot, depending on the type of stone you select. There are various types of stones available on the market, the most popular being granite, marble, onyx, limestone, travertine and slate. Some species and colors are more consistent than others. Range samples can be provided by request prior to purchasing that represent the range of a product. A single showroom display may not accurately represent a stone's complete aesthetic qualities.

HAND SELECTION

Hand selecting natural stone tiles and mosaics is impractical and is generally not accepted industry wide. However, where a specific aesthetic value is desired, range samples can be requested to represent the current lot prior to purchasing. Aesthetic appearance can be a very subjective selection process when looking at individual tiles, so the range of the product must be accepted "as is". If any adjustments need to be made to a specific range, waste factors must be accounted for during this selection process. The tiles provided are intended to represent the coloring and finish of the final shipment. Sometimes the range of a stone can be captured in 3 tiles, while other stones may require >10 samples.

CROSS VEINING IN LINEAR PATTERNS

Parallel lines that are desirable in vein cut stones may have occasional perpendicular cross veining that cut across the linear pattern. This veining is a natural occurrence just like the other colors, shades, and veining characteristics of the stone and may present itself at random. Cross veining is not a crack and does not compromise the stability of the stone. Veining is not considered a defect of the product.

STONE GRADES

Marbles and other natural stones are categorized by soundness classifications and are rated A-D by the Natural Stone Institute. This is not necessarily a quality, performance, or product usage scale, but rather a classification for character consistency and stability. This detailed grading system takes the stone's natural characteristics into consideration to set proper expectations. All travertine for example, regardless of manufacturer or country of origin, and many common colors of marble, like Crema Marfil and other commodity stones are always a Class C due to the natural presence of veins, pits and fissures. Within this grade, some quarries will separate their stones into sub-categories by identifying products as "Premium", "Plus", "Classic", "Select" etc. based on their own criteria to distinguish aesthetic consistency between lots. The "Premium" selection from one factory and supplier will be different than that of another and a Class C stone will always be a Class C regardless of the subcategory (batch aesthetic consistency) it is given. Some C and D stones are manufactured with resin reinforced mesh backing, holes are filled with cement or epoxy fillers, and rods are used for stability. Veining and coloring can be

generally inconsistent and a desired feature between modules, and chipped edges may be engineered from epoxy. Some species of stone have more inconsistencies than others, however, this is not a defect of the stone. This soundness classification guide is not to be confused with seconds, or commercial grade stones that require a good deal of fabrication to be useable.

STONE TYPES

Emser Tile's website and marketing literature may not represent the true geological nature of the stones commonly referred to in the industry as marble, granite, limestone, travertine, onyx, slate, sandstone, quartzite, etc. The true geological nature of any stone may be verified by conducting a test through an independent bona fide laboratory.

TRAVERTINE FILL COLORS

Filler colors in a prefilled travertine can vary from batch to batch as the coloring is changed to coordinate with every production run. However, it may not be an exact match to the base color of the stone due to natural stone variations.

TRAVERTINE HOLE FORMATION

Air pockets and voids are present in the stone during its formation and are a desired characteristic of the stone. Some of these holes and voids may be present under a razor thin layer of surface rock. It is not uncommon for a travertine floor to reveal new holes in the first year after installation from standard pedestrian loads, fillers dislodging, movement of fixtures and furniture. New hole formation is not considered a defect of this particular stone. If desired, these new voids can be filled quickly and easily with grout, epoxy or equivalent synthetic fillers.

RUST, EFFLORESCENCE, DISCOLORATION AND TRANSFORMATION

Presence of excessive moisture may affect the look of your stone. Efflorescence is a concentration of salt minerals trapped in the stone that become visible, similar in appearance to chalk or foam, in hot and humid climates and wet applications when water passes through the stone taking traces of salt to the surface. Rust may also appear in certain stones that have metal minerals like iron present in the body. When these minerals react with water, the water will pass through the stone bringing the oxidized metals to the surface. This is especially visible in slate, as well as lighter colored stones. It is imperative that the stones be properly sealed before and after installation and proper water proofing membranes are used to minimize and/or prevent these occurrences from happening. Six-sided sealing may be recommended to prevent discoloration in certain applications.

USING LIGHT STONES ON SHOWER FLOORS

When using light colored stones on shower floors it is important to seal the product prior to installation, ensure all weep holes are kept open during installation and do not get clogged with mortar,

and proper waterproofing measures are taken. Even when installing these products correctly, many light stones have a tendency to rust or darken over time when used as a shower floor. Sometimes these affects are immediate and other times they can take years to surface. Stone discoloration from a reaction to excessive moisture is not a defect but a natural occurrence of the product.

SEALING GRANITE

As a general rule, it is important to seal any product that has any percentage of water absorption to protect the surface. This applies to natural stones including granite, however, the only stones that typically go unsealed are black granites. When used as countertops or in wet applications, sealed black granites are known to show water marks and rings when exposed to moisture, or acids for extended periods of time. These watermarks or etchings can be caused by a number of factors, the most common is a reaction of the sealer being exposed to water for prolonged periods. The other reason may be a reaction of the mineral on the surface of the stone to acids. When using dark stones in wet applications, proper sealing and waterproofing methods must be observed based on the scope of work.

STONE FOR EXTERIOR USE

Certain stones, especially most slates and travertine, are not rated for exteriors or wet applications. Although some may do well in warm dry regions, they may be compromised when used in wet freeze/thaw environments. Although you may see photos of these types of products used successfully around pool sand patios, they may not be suitable in all climates. When used in inappropriate climates they can sometimes be maintained with additional maintenance, however, may ultimately fail if not installed or maintained correctly. Some stones can swell when they absorb water and as a result may rust, become muddy, brittle or flake excessively. Quartzite, although it looks like slate, is a completely different rock and is

perfect for wet and exterior applications as well as freeze/thaw climates. It is not uncommon for stones that look similar to have completely opposite types of performance characteristics. For this reason, it is important to check manufacturer's recommendations prior to specification.

EPOXY MORTARS- ONYX, MARBLE, SANDSTONE

It is important to use epoxy based, solid setting adhesives and grouts when installing mesh, resin, epoxy or fiberglass backed stone to ensure proper adhesion. Stones requiring epoxy, even if they are not mesh backed include; green marbles, serpentine stone, black marbles and some sandstones. These stones will typically warp or discolor from exposure to moisture during the installation process when using a standard mortar.

MORTAR COLORS

Many light stones such as marble and limestone may react negatively to the ingredients contained in gray mortars. It is highly recommended to use white mortar on light stones and gray mortar for darker ones.

STONE LIPPAGE

The presence of lippage can be exaggerated by a number of factors: uneven subfloors, laying stone in a 50% brick joint offset, not back buttering large format tiles, grout joint width being too narrow and the lighting source making standard variances more noticeable through shadowing. Industry standards allow for a certain amount of lippage to be present based on various factors. To eliminate lippage altogether, some stones may be altered by grinding and refinishing the surface after install. This procedure is to be conducted by skilled professionals and is only possible on select stones and finishes.

CARE & MAINTENANCE

CLEANING GLAZED PORCELAIN & CERAMIC

Glazed porcelain and ceramic tiles are among the easiest flooring materials to clean. Due to their impenetrable glazes, their surfaces are resistant to water, dirt, chemicals, oil, debris, and even germs and bacteria.

Always remember:

- Do not clean porcelain tile flooring with ammonia or with cleaners that contain bleach and/or acid. Acid and ammonia based cleaners may modify grout color and product stability.
- Use a cleaner that is pH neutral. This ensures cleaning will not harm your grout or surrounding surfaces.
- Do not use wax or oil-based cleaners.
- Use rugs at entrances to prevent dirt and grit from being tracked onto the tile flooring from outdoors. Tiles are scratch resistant but not scratch proof.
- Do not use steel wool or other abrasive pads to remove tough debris or stains. Steel wool scratch your tiles and loose steel particles may eventually create rust stains in the grout over time.
- Although glazed surfaces are impervious, the use of a grout release will aid in post installation clean up, especially if the glazed surface has a texture to it where mortar, grout and other construction debris can get trapped inside grooves during and after installation.

Standard cleaning guidelines of glazed products:

- Sweep or vacuum loose dirt and dust from the floor prior to washing with water to prevent the tile from becoming muddy or leaving a residue after cleaning. On textured surfaces sweep in multiple directions to ensure the removal of all foreign material that might be residing in the textured surface. For wall surfaces tile can be gently wiped down with a clean, dry cloth or rag.
- Mop the floor with a mild detergent, degreaser, or tile cleaning solution. For textured floors, the use of a medium bristle brush is recommended. A sponge or clean cloth can be used to apply the cleaning agent to wall surfaces.
- Rinse the tile thoroughly with clean water to remove any left-over detergents.
- Drying with a clean cloth or rag is recommended to increase the shine and to prevent water spots or streaks.

CLEANING UNGLAZED PORCELAIN & CERAMIC

Unglazed products are highly desirable due to their double loaded and through-body characteristics. Polished finishes are typically protected by nano and/or wax coatings and are resistant to water, chemicals, and scratching. Matte and textured finishes are generally unprotected and although the surface is impervious, it

may be more difficult to clean post install than a polished surface due to the inherent surface characteristics of these finishes on a micro pore level.

Always remember:

- Do not clean porcelain tile flooring with ammonia or with cleaners that contain bleach and/or acid.
- Acid and ammonia based cleaners may modify grout color and product stability.
- Use a cleaner that is pH neutral. This ensures cleaning will not harm your grout or surrounding surfaces.
- Do not use wax or oil-based cleaners.
- Use rugs at entrances to prevent dirt and grit from being tracked onto the tile flooring from outdoors.
- Tiles are scratch resistant but not scratch proof.
- Do not use steel wool or other abrasive pads to remove tough debris or stains. Steel wool may scratch your tiles and loose steel particles may eventually create rust stains in the grout over time.
- Nano coatings should remain intact post install for added protection. However, if electing to remove nano coatings, a nano scrub or poultice type product may be used. Ask a sales associate for details.
- Although unglazed surfaces are impervious, the use of a grout release will aid in post install clean-up, especially if the unglazed surface has a matte or textured finish to it where construction debris can get trapped during grouting. Sealing may also be recommended post install to aid in day-to-day maintenance of these surfaces.
- It is suggested that a breathable penetrating sealer be applied to matte unglazed surfaces after grouting. This treatment provides an excellent defense against staining and may be desirable in high traffic areas. Follow the sealing manufacturer's guidelines for recommendations on how often a sealer should be reapplied.

Standard cleaning guidelines of unglazed products:

- Sweep or vacuum loose dirt and dust from the floor prior to washing with water to prevent the tile from becoming muddy or leaving a residue after cleaning. On textured surfaces sweep in multiple directions to ensure the removal of all foreign material that might be residing in the textured surface. For wall surfaces tile can be gently wiped down with a clean, dry cloth or rag.
- Mop the floor with a mild detergent, degreaser or tile cleaning solution. For textured floors, the use of a medium bristle brush is recommended. A sponge or clean cloth can be used to apply the cleaning agent to wall surfaces.

- Rinse the tile thoroughly with clean water to remove any left-over detergents.
- Drying with a clean cloth or rag is recommended to increase the shine and to prevent water spots or streaks.

CLEANING GLASS, METAL & DECORATIVE MOSAICS

Many of the metal tiles you see on the market today are made from solid metal, coated in metal glazes, or cast from polymers that are fused with real metal particles. Due to the presence of actual metal in most cases, careful attention must be paid when cleaning these unique surfaces. Glass is one of the easiest surfaces to clean. Due to its impervious nature, all stains will remain on the surface and can be wiped away with no effort. When cleaning glass and/or resin based blends the least abrasive method should always be used first as not to damage, discolor, or scratch the surface.

Always remember:

- Stainless steel cleaners for appliances tend to work well on stainless steel tiles as they are typically made from similar grades of steel. However, it is important to note that not all metal tiles are made from stainless steel and as such a pH neutral cleaner or water with a mild soap solution can be used.
- It is not recommended that any abrasive cleaners or scouring pads be used to clean metal as it may scratch the surface and cause the tiles to oxidize.
- It is also important to keep the tiles dry and away from heat as much as possible.
- Be sure to follow grout manufacturer's instructions on cleaning and sealing grout properly.
- Grout cleaners containing bleach or ammonia may be harmful to the metal if not applied properly.
- Do not use any abrasive cleaners or scouring pads to clean glass as they may scratch the surface.
- There are many cleaning solutions on the market today suitable for cleaning glass tile. In most cases a standard glass or multi-surface cleaner applied with a cloth or paper towels will work well.

Standard cleaning guidelines of glass, metal and decorative products:

- Wipe loose dirt or grease from the surface. An untreated paper towel or cloth is recommended.
- Wash the surface with a mild detergent, degreaser, or glass cleaning solution (do not use abrasive cleaners or abrasive applicators).
- Rinse the tile thoroughly with clean water if a detergent is used.
- Drying with a clean cloth or paper towel is recommended to increase the shine and to prevent water spots or streaks.

CLEANING NATURAL & ENGINEERED STONE

Natural stone is a very durable surface when protected and

maintained properly and is widely used in residential and commercial applications.

Always remember:

- Sweep or vacuum your floors regularly.
- Protect your stone from sand and grit as floors may scratch from dirt and debris.
- Be careful with acidic foods and drinks (lemonade, orange juice, etc.) as they may etch certain stones.
- Never use any cleaners that contain ammonia, acids, or bleach.
- Never apply wax or acrylics to the surface as they may damage the stone.
- Tend to spills quickly. Sealers do not prevent 100% of damages caused by spills.
- Sealing all natural stone is highly recommended.
- It is suggested that a breathable penetrating sealer be applied before and after grouting. This treatment provides an excellent defense against staining and may be desirable in high-traffic areas. Follow the sealing manufacturer's guidelines for recommendations on how often a sealer should be reapplied.

Standard cleaning guidelines for natural stone:

- Sweep or vacuum loose dirt and dust from the floor. For wall surfaces, tile can be gently wiped down with a clean, dry cloth or rag.
- Mop the floor with a mild detergent, degreaser, or tile cleaning solution. A sponge or clean cloth can be used to apply the cleaning agent to wall surfaces.
- Rinse the tile thoroughly with clean water to remove any left-over detergents.
- Drying with a clean cloth or rag is recommended to increase the shine and to prevent water spots or streaks.

COMMERCIAL DEEP CLEANING

Commercial cleaning can present its own challenges due to the high traffic nature of most applications and exposure to foreign debris that a standard residential application may not be subject to. Commercial floors must be maintained properly to ensure the longevity of an application.

Always remember:

In addition to following standard cleaning protocol for your product type, also consider the following:

- Floors need to be kept as dry as possible after cleaning to prevent slip accidents
- When mopping, the water should be changed frequently so you are not pushing around muddy water
- Scrubbing the floors too often with a buffer may cause irregular wear patterns
- Always be sure to protect furniture legs and stanchions with felt pads to protect the floors from scratching

CARE & MAINTENANCE (CONT.)

- Chewing gum, grease and other debris difficult to remove may require use of a plastic putty knife
- Prior to removing graffiti and other difficult stains, test a small area to make sure the chemical agents will not damage the surface.
- For embedded stains, the use of a poultice mix may be required
- When electing to remove nano coatings, a nano scrub or poultice type product may be used
- Prolonged use of bleach and ammonia based products may cause the grout to become brittle over time and in wet applications may result in water damage due to cracking and deterioration.
- Sealing grout prevents staining. Sealers are not chemical proof and may break down from continued exposure to harsh household chemical cleaners.
- It is suggested that a breathable penetrating sealer be applied before and after grouting. This treatment provides an excellent defense against staining, mold and mildew. Follow the sealing manufacturer's guidelines for recommendations on how often a sealer should be reapplied.

Standard deep cleaning guidelines:

- Sweep or vacuum loose dirt and dust from the floor. For wall surfaces, tile can be gently wiped down with a clean, dry cloth or rag.
- Mix a high concentration cleaner, degreaser, or stripper as needed based on manufacturer's guidelines for periodic deep cleaning.
- Agitate with scrub brush or floor scrub machine.
- Mop up dirty solution. A wet/dry vac may be used in large areas.
- Rinse thoroughly with clean water, changing water every 500 sq. ft. or as needed.
- Drying with a clean cloth or rag as well as a final dry vac extraction is recommended to increase the shine, prevent water spots and streaks, and to prevent slip accidents in a commercial setting.

CLEANING GROUT

There are many grouts on the market today that are stain resistant and do not require a sealer. However, not all grouts will have these characteristics and special care must be taken to ensure product performance is not compromised due to exposure to harsh cleaners.

Always remember:

- Clean tile and stone regularly according to standard cleaning guidelines. Anything safe for the tile will typically be safe for your grout. PH neutral cleaners are highly recommended. Mopping dirty tiles will cause muddy water to get stuck in the grout joints, so keeping tiles cleaned regularly will improve the look of the grout.
- Be careful with acidic foods, drinks and dyes as they may stain certain types of grout.
- Never use cleaners that contain ammonia, acids, or bleach. Some stains may be set so deep in the grout that bleach may be the only thing to get your grout clean. Bleaching causes the pores of the grout to open and hold dirt even more. As such, sealing after bleaching is highly recommended.

Standard cleaning guidelines for grout:

- Sweep, brush, or vacuum loose dirt and dust from the surface. For wall surfaces, grout can be gently wiped down with a clean, dry cloth or rag.
- Mop, brush, or sponge the surface with a mild detergent, degreaser, or tile cleaning solution.
- Rinse the grout thoroughly with clean water to remove any left-over detergents.
- Drying with a clean cloth or rag is recommended to prevent water spots or streaks on the tile.
- Reseal grout periodically as needed.

Pre and post grout install tips:

Using a grout release or sealer prior to installation is recommended especially for product that is porous or has a textured surface. Often times grout particles may become trapped and difficult to clean during the standard grouting process and the use of a rag or sponge may not pull up all the grout haze. Using a grout release and/or sealer will help prevent this from happening. Also important to note is that grout haze left on the surface of a tile will become difficult to remove and the chemicals needed to remove it at a later time may damage the tile or alter its looks. Heavy duty grout haze removers should be used according to the grout manufacturer's recommendations before trying more concentrated acid solutions.

WARRANTIES INFORMATION

ONE YEAR LIMITED WARRANTY AND LIMITATIONS ON LIABILITY

Emser Tile® offers a limited warranty on its products to the original purchaser, for one year from the date of purchase, to be free of manufacturing defects. Emser warrants only to its immediate customers and to no other person that its products will, on the date of ship, meet the foregoing terms of Emser's bid confirmation, order acknowledgement or sales order pursuant to which such products were sold. Tile and natural stone are subject to standard variances resulting from the manufacturing process or origin. Emser Tile® does not provide warranty on products that are within the industry standard variance levels.

DEFECTS & CLAIMS

In the event of a defect within any product distributed to the customer by Emser Tile®, the customer agrees to notify Emser immediately upon becoming aware of such defect. If a defect in manufacturing or coloring is identified in advance of installation, the customer agrees to not install any defective product without the written agreement of Emser Tile®.

Emser Tile® reserves the right to inspect any and all defects prior to any repair, remediation or settlement of such defect. In the event that Emser Tile® is required to participate in the repair, remediation or settlement of any defect, Emser must be included in all discussions and decisions related to such repair, remediation and/or settlement. In the event that the customer fails to notify Emser on a timely basis, or fails to allow Emser the right of inspection, discussion or decision making in advance of repair, remediation or settlement of any defect, the customer agrees to release Emser Tile® from any liability for the defect or claim. Customer misuse including negligence, physical or chemical abuse is not covered by this warranty. Improper installation, installation defects or errors are not covered by this warranty. Warranty claims must be submitted in within 30 days upon discovery of the proposed defect.

NATURAL STONES

Emser Tile®'s website and marketing literature may not represent the true geological nature of the stones commonly referred to in the industry as marble, granite, limestone, travertine, onyx, slate, sandstone, quartzite, etc. The true geological nature of any stone may be verified by conducting a test through an independent bona fide laboratory.

TOOLS & SUPPLIES

Prep

- Floor Prep and Leveling
- Moisture Mitigation
- Tile Backerboard
- Lath and Wire
- Crack Isolation & Sound Control
- Waterproofing Membranes

Set

- Polymer Modified Large Format Tile & Stone and Thinset Mortars
- Rapid Setting Mortars
- Thick Bed Mortars
- Stone Veneer Installation Systems
- Outdoor Paver Solutions

Grout

- Sanded and Non-Sanded Grout
- High Performance Grout
- Epoxy and Industrial Grade Epoxy Grout
- Ready To Use Grout
- Single Component High-Performance Grout
- Specialty Designer Series Grouts and Limited Edition Offerings

Care

- Impregnating Sealers
- Cleaners & Resealers
- Problem Solvers
- Restoration and Colorants
- Anti-Slip Coatings

Accessory Categories

- Lippage Prevention Systems for installing Large Format Tiles and achieving perfectly Flat Floors
- Shower System Solutions that save you time and labor
- Full line of tools to complete the job from demo work to installation
- Floor Heating Systems
- Metal and PVC Profile Solutions
- Floor Protection Products for all hard surfaces and carpet to prevent damage to newly installed work
- Full Line of PPE - Respirators, Protective Eye wear, Hearing Protection, Gloves, and more

Emser Tile® offers trainings for our professional customers – in-person at our locations, virtually, and in conjunction with our Supplier Partners at their facilities. Talk to your local Emser Sales Representative about upcoming trainings in your market.
